Cover Letter: Forward Deployed Software Engineer

PhysicsX Singapore 2026-08-10

I am applying for Forward Deployed Software Engineer at PhysicsX. Your AI-driven simulation stack — high-fidelity multi-physics via AI inference, serving aerospace and defence, materials, energy, semiconductors and automotive — is where engineers build better, faster and cheaper. I want to help your customers solve their hardest problems on site.

I am an NUS Information Systems graduate and Ngee Ann Polytechnic IT (N54) — CSIT Scholar and Director's List — with breadth across full-stack software engineering, API design and deploying applications to production. I build RESTful APIs and microservices, and I am comfortable across Helm, Kubernetes, Terraform and cloud on AWS and Azure.

- **Designed internal and shadow API strategy,** whitepaper on API design and integration — the surface this role uses to serve Large Physics Models via REST and microservices
- **Built end-to-end applications with customers in mind,** shaped tools with constant user feedback, from low-lift prototype to customer workflow
- **Recognised for proactivity and ownership,** CSIT Scholar and Director's List — track record of picking up new skills to solve novel problems end to end
- **Ready to travel and deliver on site,** based in Singapore and available for on-site collaboration across Asia, North America and Europe for several weeks per quarter

Customers need physics AI models shipped as usable tools, not demos. I will collaborate with data scientists, ML engineers and designers to distil complex solutions into platform components, build FastAPI microservices, shape UX, deploy via Helm and Kubernetes, and iterate directly with engineers on the factory floor.

Available for on-site delivery and travel. Salary expectations upon request. Tailored CV attached without invented stack.
