Aiko — Due-Diligence Dossier

Aiko — Due-Diligence Dossier

> ***Confidential.*** *Prepared for investor due diligence. Not for distribution. This dossier describes proprietary architecture; please do not share it.*

What Aiko is, in one paragraph

Aiko is an agent that lives on your laptop and does the things you'd do, so you don't have to. Coworkers bombing you on Telegram — Aiko tells you what actually applies to you and replies in your voice. Your mum's birthday — Aiko finds a restaurant nearby and books a table for six at 6:30. *If you can do it on your laptop, ask Aiko.* Under the hood, Aiko is not a wrapper around a frontier LLM. It is a **fractal energy-based harness**: a substrate that routes, verifies, and learns from doing — grounding a small local model with a live index and a shared, auditable memory, so it gets *twice the reliability at half the cost* of running a large model for computer use.

The three pillars (the pitch)

Pillar	The claim	Honest status (see §Status legend)
Reliable	Our own Energy-Based model for computer use, trained on-device; twice the reliability, half the cost	Harness + energy router **BUILT+PROVEN**; the "2× / ½" figures are **DESIGN targets, not yet independently benchmarked**
Private	Weights on-chain; zero-knowledge credential binding; your data stays yours; Solana volume makes the product pay for itself	Local inference + sealed data + reward economics **BUILT/DESIGNED**; **ZK credential binding is RESEARCH-DIRECTION, not built**
Powerful	A new architecture lets Aiko learn *as it works*	Train-on-fire + energy-ranked resolution **BUILT+PROVEN** as a router; "reasoning-grade intelligence" is a **falsifiable bet, not a result**

We state the limits as loudly as the vision — that is the substrate's own tradition, and this dossier keeps it. Where something is a target or a direction, it says so, in the same breath as the claim.

The bet (why this is a different scaling law)

Frontier AI scales intelligence as **parameters × data × compute** — static, centralized, and *your data trains their model*. Aiko scales it as **index coverage × collective firing history × routing/verification quality** — live, distributed, and *your data stays yours*. Knowledge lives in a retrievable index, not in frozen weights, so **the marginal cost of a thought falls toward the cost of a lookup and a fold**. That is the whole thesis; everything else is mechanism.

How to read this dossier

#	Document	What it answers
00	**README-DUE-DILIGENCE** (this)	What is it, what's the pitch, how to navigate
01	**PRODUCT-aiko**	What does the user get; the use cases; why it beats a raw LLM for computer use
02	**ARCHITECTURE-fractal-ebm-harness**	How it works, grounded in the actual code
—	**THESIS-collective-nonparametric-intelligence**	The intellectual bet + the honest wall (foundation)
—	**ECONOMICS-cooperative-commons**	The token, the commons, the reward economics
03	**ONCHAIN-privacy-solana**	Weights on-chain, the frecency cache, the Solana moat, privacy & ZK
04	**PROOF-traction**	What is built and *proven*, with test evidence
05	**RISK-honest-wall**	The risk register — where this breaks and what must be true
06	**DUE-DILIGENCE-FAQ**	Direct answers to the diligence questions

Start at 01 for the product, 02 for the tech, 04 for the proof, 05 for the risks.

Status legend

Every substantive claim in this dossier is tagged:

- **BUILT+PROVEN** — code exists on the `arc-lean` branch with tests that pass in the build gate; verifiable by reading the source and running `zig build test`.
- **DESIGNED** — specified in detail, mechanism worked out, not yet fully built or not yet exercised end-to-end on production data.
- **RESEARCH-DIRECTION** — a bet or an open problem; plausible, motivated, but unproven at this scale. This is where the honest wall lives.

If a claim is not tagged, treat it as narrative framing, not a technical assertion.

Where the company is, honestly

One founder, deep in a two-to-three-month build. The harness is real and running locally; it has one-shotted tasks most agents cannot (see 04). It is **not yet publicly released** — deliberately: the energy-based design is power-hungry and is being contained, and the on-chain layer is being hardened. The pivot from the original Unbrowse (a commons for agents to browse the internet) to Aiko (an agent that "unbrowses" your *own computer's context*) is recent and partial; Unbrowse still exists and is the sister project this inverts. This dossier documents the Aiko direction as it stands today, with the seams visible.
